

09/673,823  
Atty Docket: 42P9904

Amendments to the Claims:

1-2. (canceled)

3. (currently amended)      A method comprising:

selecting a protected content sink device for display of a content stream, the selecting further comprising:

requesting, by the source application, a graphics driver to provide mode information for each content sink device attached to a graphics controller, the mode information describing a display content stream path used to route content to the protected content sink device; and

selecting, as the protected content sink device, a content sink device implementing a content protection protocol based on the mode information provided by the graphics driver, thereby ensuring no unauthorized duplication of content displayed by the content sink device;

storing, by a content stream source application, an expected session identification code of a display content stream path from which content is received by the protected content sink device;

opening a secure connection between the content stream source application and a transmitter/codec unit attached to the protected content sink device;

transmitting the content stream to the transmitter/codec unit along with an updated session identification code that is stored by the transmitter/code unit and identifies the display content stream path on which the content stream was transmitted;

requesting, by the content stream source application, the updated session identification code from the transmission/codec unit using a content protection protocol; and

comparing the updated session identification code received from the transmitter/codec unit against the expected session identification code to ensure that the content display stream has not been routed to an unprotected content sink device.

09/675,823  
Atty Docket: 42P9904

wherein prior to the selecting the protected content sink device, the method further comprises:

generating a series of session identification codes for each display content stream path supported by a graphics controller; and

transmitting, by the graphic controller, a session identification code to a corresponding transmitter/codec unit from the series of session identification codes for each transmitter/code unit attached to the graphics controller, and

~~The method of claim 2,~~ wherein the generating the series of session identification codes further comprises:

generating an input connection state for a display content stream path indicating one or more input content streams to the graphics controller that follow the display content stream path;

generating a pipe identification code for the display content stream path indicating a pixel stream pipe traversed by the display content stream path;

generating an output connection state for the display content stream path indicating one or more output ports that the display content stream path traverses;

generating a device identification code for the display content stream path uniquely identifying the graphics controller in which the display content stream path is contained, such that the session identification code for the display content stream path includes the input connection state, the output connection state, the pipe identification code and the device identification code;

transmitting the session identification code to each transmitter/codec unit attached to an output port from the one or more output ports indicated by the output connection state; and

repeating the generating, generating, generating, generating and transmitting steps for each display content stream path of each graphics controller.

4. (previously presented) A method comprising:

generating a series of session identification codes for each display content stream path supported by a graphics controller, the generating comprising:

09/675,823  
Atty Docket: 42P9904

generating an input connection state for a display content stream path indicating one or more input content streams to the graphics controller that follow the display content stream path;

generating a pipe identification code for the display content stream path indicating a pixel stream pipe traversed by the display content stream path;

generating an output connection state for the display content stream path indicating one or more output ports that the display content stream path traverses;

generating a device identification code for the display content stream path uniquely identifying the graphics controller in which the display content stream path is contained, such that the session identification code for the display content stream path includes the input connection state, the output connection state, the pipe identification code and the device identification code;

transmitting the session identification code to each transmitter/codec unit attached to an output port from the one or more output ports indicated by the output connection state; and

repeating the generating, generating, generating, generating and transmitting steps for each display content stream path of each graphics controller;

transmitting, by the graphic controller, a session identification code to a corresponding transmitter/codec unit from the series of session identification codes for each transmitter/code unit attached to the graphics controller;

selecting a protected content sink device for display of a content stream;

storing, by a content stream source application, an expected session identification code of a display content stream path from which content is received by the protected content sink device;

opening a secure connection between the content stream source application and a transmitter/codec unit attached to the protected content sink device;

transmitting the content stream to the transmitter/codec unit along with an updated session identification code that is stored by the transmitter/code unit and identifies a display content stream path on which the content stream was transmitted;

09/675,823  
Atty Docket: 42P9904

requesting, by the content stream source application, the updated session identification code from the transmission/codec unit using a content protection protocol; and

comparing the updated session identification code received from the transmitter/codec unit against the expected session identification code to ensure that the content display stream has not been routed to an unprotected content sink device,

wherein the generating the device identification code further comprises:

submitting a device code of a respective graphic controller to a linear feedback shift register; and

clocking the linear feedback shift register at a pixel rate of the content display stream to ensure the device code of the respective graphic controller is unique.

5. (currently amended) The method of claim [[1]] 3, wherein transmitting the session identification code to the transmission/codec unit further comprises:

receiving, by a graphic controller, the content stream from the content stream source application for display on the protected content sink device;

transmitting the updated session identification code to the transmission/codec unit during a vertical blanking interval in the content stream;

detecting, by the transmission/codec unit, a vertical blanking interval signal within the content stream;

latching, by the transmission/codec unit, the updated session identification code when the vertical blanking interval signal is detected; and

repeating the transmitting, detecting and latching steps for a duration of the content stream.

6. (currently amended) The method of claim [[1]] 3, further comprising:

performing the transmitting, requesting and comparing after a predetermined period of time; and

repeating the performing while the content stream is displayed on the protected content sink device.

09/675,823  
Atty Docket: 42P9904

7. (currently amended) The method of claim [[1]] 3, wherein comparing the session identification code further comprises:

receiving a status word containing the updated session identification code from the transmitter/codec unit;

computing a digital signature across the status word to verify the authenticity of the status word; and

comparing the updated session identification code against the expected session identification code; and

when the updated session identification code is not equal to the expected session identification code, discontinuing transmission of the content stream.

8-9. (canceled)

10. (currently amended) The apparatus of claim 9, An apparatus comprising: one or more transmitter/codec units, each attached to a respective display content stream path from which content is received and each to store an expected session identification code identifying the respective display content stream path attached to the transmitter/codec unit;

a graphics controller to transmit content to transmitter/codec units attached to a display content stream path along with an updated session identification code that is stored by the transmitter/codec units and to identify the display content stream path on which the content stream was transmitted;

one or more content sink devices display content transmitted by the graphics controller; the a content source application to select a protected content sink device for display of a content stream, to open a secure connection with a transmitter/codec unit attached to the protected content sink device, to request the updated session identification code from the transmission/codec unit using a content protection protocol and to compare the updated session identification code against the expected session identification code to ensure that the content display stream has not been routed to an unprotected content sink device; and

a graphics driver to provide mode information for each content sink device attached to the graphics controller in response to a request by the source application, the mode information

09/675,823  
Atty Docket: 42P9904

describing a display content stream path used to route content to the protected content sink device such that the source application selects, as the protected content sink device, a content sink device implementing a content protection protocol based on the mode information ensuring no unauthorized duplication of content displayed by the content sink device,

wherein the graphics controller includes:

an input selection device having one or more input content streams as inputs and one or more pixel stream pipes as outputs, receives the content stream and directs the content stream to a pixel stream pipe along a display content stream path identified by the updated session identification code using input selection information;

a blender that receives the content stream and mixes context planes within the content stream into a content pixel stream prior to being provided to the pixel stream pipe;

an output selection device having the one or more pixel stream pipes as inputs and one or more output ports as outputs, receives the content pixel stream from the pixel stream pipe and directs the content pixel stream to an output port along the display content stream path using output selection information; and

a sequencer transmits the updated session identification code to the transmission/codec unit during a vertical blanking interval in the content stream provided by the source application.

11. (previously presented) An apparatus, comprising:

one or more transmitter/codec units, each attached to a respective display content stream path from which content is received and each stores an expected session identification code identifying the respective display content stream path attached to the transmitter/codec unit;

a graphics controller transmits content to transmitter/codec units attached to a display content stream path along with an updated session identification code that is stored by the transmitter/codec units and identifies the display content stream path on which the content stream was transmitted, the graphics controller including:

an input selection device having one or more input content streams as inputs and one or more pixel stream pipes as outputs, receives the content stream and directs the content stream to a pixel stream pipe along a display content

09/675,823  
Atty Docket 42P9904

stream path identified by the updated session identification code using input selection information;

a blender that receives the content stream and mixes context planes within the content stream into a content pixel stream prior to being provided to the pixel stream pipe;

an output selection device having the one or more pixel stream pipes as inputs and one or more output ports as outputs, receives the content pixel stream from the pixel stream pipe and directs the content pixel stream to an output port along the display content stream path using output selection information; and

a sequencer transmits the updated session identification code to the transmission/codec unit during a vertical blanking interval in the content stream provided by the source application;

one or more content sink devices display content transmitted by the graphics controller;  
and

a content source application selects a protected content sink device for display of a content stream, opens a secure connection with a transmitter/codec unit attached to the protected content sink device, requests the updated session identification code from the transmission/codec unit using a content protection protocol and compares the updated session identification code against the expected session identification code to ensure that the content display stream has not been routed to an unprotected content sink device,

wherein the graphics controller further comprises:

a linear feedback shift register that receives a device code of a respective graphics controller and is clocked at a pixel rate of the content display stream to ensure the device code of the respective graphics controller is unique, such that the updated session identification code for the display content stream path includes the input selection information, the output selection information, a pipe identification code identifying the pixel stream pipe traversed by the content stream and the unique device code.

09/675,823  
Atty Docker 42P9904

12. (currently amended) The apparatus of claim [[9]] 10, further comprising:  
one or more digital visual output ports, such that each transmitter/codec unit is coupled to  
the graphics controller by a respective digital visual output port from the one or more digital  
visual output ports.

13-14. (canceled)

15. (currently amended) An apparatus comprising: The apparatus of claim 14,  
one or more transmitter/codec units, each storing an expected session identification code  
identifying a display content stream path from which content is received and transmitting the  
content to a content sink device;

a graphics controller transmitting content to the one or more transmitter/codec units along  
with an updated session identification code that is stored by the transmitter/codec unit and  
identifies a display content stream path on which the content stream was transmitted;  
a storage medium containing a plurality of programming instructions implements a  
content source application which, when executed, directs content source application to select a  
protected content sink device from a one or more content sink devices for display of a content  
stream, opens a secure connection with a transmitter/codec unit attached to the protected content  
sink device, requests the updated session identification code from the transmission/codec unit  
using a content protection protocol and compares the updated session identification code against  
the expected session identification code to ensure that the content display stream has not been  
routed to an unprotected content sink device;

a processor to execute the plurality of program instructions; and

a graphics driver to provide mode information for each content sink device attached to the  
graphics controller in response to a request by the source application, the mode information  
describing a display content stream path used to route content to the protected content sink  
device such that the source application selects, as the protected content sink device, a content  
sink device implementing a content protection protocol based on the mode information ensuring  
no unauthorized duplication of content displayed by the content sink device,

wherein the graphics controller includes:

09/675,823  
Atty Docket 42P9904

an input selection device having one or more input content streams as inputs and one or more pixel stream pipes as outputs, receives the content stream and directs the content stream to a pixel stream pipe along a display content stream path identified by the updated session identification code using input selection information;

a blender that receives the content stream and mixes context planes within the content stream into a content pixel stream prior to being provided to the pixel stream pipe;

an output selection device having the one or more pixel stream pipes as inputs and one or more output ports as outputs, receives the content pixel stream from the pixel stream pipe and directs the content pixel stream to an output port along the display content stream path using output selection information; and

a sequencer transmits the updated session identification code to the transmission/codec unit during a vertical blanking interval in the content stream provided by the source application.

16. (previously presented) An apparatus comprising:

one or more transmitter/codec units, each storing an expected session identification code identifying a display content stream path from which content is received and transmitting the content to a content sink device;

a graphics controller transmitting content to the one or more transmitter/codec units along with an updated session identification code that is stored by the transmitter/codec unit and identifies a display content stream path on which the content stream was transmitted, the graphics controller including:

an input selection device having one or more input content streams as inputs and one or more pixel stream pipes as outputs, receives the content stream and directs the content stream to a pixel stream pipe along a display content stream path identified by the updated session identification code using input selection information;

a blender that receives the content stream and mixes context planes within the content stream into a content pixel stream prior to being provided to the pixel stream pipe;

09/675,823  
Atty Docket: 42P9904

an output selection device having the one or more pixel stream pipes as inputs and one or more output ports as outputs, receives the content pixel stream from the pixel stream pipe and directs the content pixel stream to an output port along the display content stream path using output selection information; and  
a sequencer transmits the updated session identification code to the transmission(codec unit during a vertical blanking interval in the content stream provided by the source application;

a storage medium containing a plurality of programming instructions implements a content source application which, when executed, directs content source application to select a protected content sink device from a one or more content sink devices for display of a content stream, opens a secure connection with a transmitter(codec unit attached to the protected content sink device, requests the updated session identification code from the transmission(codec unit using a content protection protocol and compares the updated session identification code against the expected session identification code to ensure that the content display stream has not been routed to an unprotected content sink device; and

a processor to execute the plurality of program instructions,  
wherein the graphics controller further comprises:

a linear feedback shift register that receives a device code of a respective graphics controller and is clocked at a pixel rate of the content display stream to ensure the device code of the respective graphics controller is unique, such that the update session identification code for the display content stream path includes the input selection information, the output selection information, a pipe identification code identifying the pixel stream pipe traversed by the content stream and the unique device code.

17. (currently amended) The apparatus of claim [[14]] 15, further comprising:  
one or more digital visual output ports, such that each transmitter(codec unit is coupled to the graphics controller by a respective digital visual output port from the one or more digital visual output ports.

18. (canceled)

09/675,823  
Atty Docker 42P9904

19. (currently amended) An article of manufacture comprising:  
a storage medium have stored thereon a plurality of programming instructions  
implementing a content source application which, when executed, direct the source application to  
select a protected content sink device for display of a content stream having an attached  
transmitter/codec unit containing an expected session identification code, open a secure  
connection with the transmitter/codec unit, transmit the content stream to the transmitter/codec  
unit along with an updated session identification code that is stored by the transmitter/code unit  
and identifies a display content stream path on which the content stream was transmitted, and  
request the updated session identification code from the transmitter/codec unit and compare the  
updated session identification code received from the transmitter/codec unit against the expected  
session identification code to ensure that the content display stream has not been routed to an  
unprotected content sink device,

wherein the instruction for selecting the protected content sink device further includes  
instructions for:

requesting, by the source application, a graphics driver to provide mode information for  
each content sink device attached to a graphics controller, the mode information describing a  
display content stream path used to route content to the protected content sink device; and

selecting, as the protected content sink device, a content sink device implementing a  
content protection protocol based on the mode information provided by the graphics driver  
ensuring no unauthorized duplication of content displayed by the content sink device, and

further comprising instructions to be executed prior to selecting the protected content sink  
device, wherein the instructions when executed direct the source application to:

generate a series of session identification codes for each display content stream  
path supported by a graphics controller;

transmit, by the graphics controller, a session identification code to a  
corresponding transmitter/codec unit from the series of session identification codes for  
each transmitter/code unit attached to the graphics controller, and

wherein the generating the series of session identification codes further comprises  
instructions to:

09/675,823  
Atty Docket 42P9904

generate an input connection state for a display content stream path indicating one or more input content streams to the graphics controller that follow the display content stream path;

generate a pipe identification code for the display content stream path indicating a pixel stream pipe traversed by the display content stream path;

generate an output connection state for the display content stream path indicating one or more output ports that the display content stream path traverses;

generate a device identification code for the display content stream path uniquely identifying the graphics controller in which the display content stream path is contained, such that the session identification code for the display content stream path includes the input connection state, the output connection state, the pipe identification code and the device identification code;

transmit the session identification code to each transmitter/codec unit attached to an output port from the one or more output ports indicated by the output connection state; and

repeat the generating, generating, generating, generating and transmitting steps for each display content stream path of each graphics controller.

20. (canceled)

21. (previously presented) An article of manufacture comprising:

a storage medium have stored thereon a plurality of programming instructions implementing a content source application which, when executed:

generate a series of session identification codes for each display content stream path supported by a graphics controller;

transmit, by the graphic controller, a session identification code to a corresponding transmitter/codec unit from the series of session identification codes for each transmitter/code unit attached to the graphics controller;

09/675,823  
Atty Docket: 42P9904

direct the source application to select a protected content sink device for display of a content stream having an attached transmitter/codec unit containing an expected session identification code;

open a secure connection with the transmitter/codec unit;

transmit the content stream to the transmitter/codec unit along with an updated session identification code that is stored by the transmitter/code unit and identifies a display content stream path on which the content stream was transmitted;

request the updated session identification code from the transmitter/codec unit; and

compare the updated session identification code received from the transmitter/codec unit against the expected session identification code to ensure that the content display stream has not been routed to an unprotected content sink device,

wherein the instruction for generating the series of session identification codes further includes instructions for:

generating an input connection state for a display content stream path indicating one or more input content streams to the graphics controller that follow the display content stream path;

generating a pipe identification code for the display content stream path indicating a graphic controller pipe traversed by the display content stream path;

generating an output connection state for the display content stream path indicating one or more output ports that the display content stream path tranverses;

generating a device identification code for the display content stream path uniquely identifying the graphics controller in which the display content stream path is contained, such that the session identification code for the display content stream path includes the input connection state, the output connection state, the pipe identification code and the device identification code; and

repeating the generating, generating, generating and generating steps for each display content stream path of each graphics controller.

22. (original) The article of manufacture of claim 21, wherein the instruction for the generating the device identification code further includes instructions for:

09/675,823  
Atty Docket: 42P9904

submitting a device code of a respective graphic controller to a linear feedback shift register; and

clocking the linear feedback shift register at a pixel rate of the content display stream to ensure the device code of the respective graphic controller is unique.

23. (original) The article of manufacture of claim 19, wherein the instruction for transmitting the session identification code to the transmission/codec unit further includes instructions for:

receiving, by a graphic controller, the content stream from the content stream source application for display on the protected content sink device;

transmitting the session identification code to the transmission/codec unit during a vertical blanking interval in the content stream;

detecting, by the transmission/codec unit, a vertical blanking interval signal within the content display stream;

latching, by the transmission/codec unit, the session identification code when the vertical blanking interval signal is detected; and

repeating the transmitting, detecting and latching steps for a duration of the content stream.

24. (original) The article of manufacture of claim 19, further including instructions for: performing the transmitting, requesting and comparing steps after a predetermined period of time; and

repeating the performing step while the content stream is displayed on the protected content sink device.

25. (previously presented) The article of manufacture of claim 19, wherein the instruction for comparing the session identification code further includes instructions for:

receiving a status word containing the updated session identification code from the transmitter/codec unit;

09/675,823  
Atty Docket: 42P9904

computing a digital signature across the status word to verify the authenticity of the status word;

comparing the updated session identification code against the expected session identification code; and

when the updated session identification code is not equal to the expected session identification code, discontinuing transmission of the content stream.

26. (canceled)
